I've tried to make a startup disk as well as a live cd of W10, but neither is working. It's also having a funny little bit where it's showing me 2 times the number of CPU cores instead of 6 (more along the lines of 4.) I've been trying to get Ubuntu as my boot loader (as per the Xubuntu guide) but still getting the errors. Is there anything else I can do to get it booting? I can't afford to spend hours on this and I'm really struggling to get any help. A: In the past, this was called an iSCSI drive. If your motherboard supports it, then it should be listed as such in the BIOS. Then you can boot from it. There was also a time when you could install GRUB on an iSCSI drive, though that is of little use to you now. Try these first: The disk is recognized in the BIOS as an iSCSI disk. You have a serial number on the disk. These will help you install a bios update if required. You can also check that it is the correct disk in the BIOS if you can boot into the live cd and open a terminal, then you can run this command to see which disks are visible: ls /dev/sda -lh You can then check this disk for errors I do not think that WUBI is still supported for x64. I think you have to install it in the same way as a normal windows installation. You are here Hydrothermal Vent Seeps Hydrothermal vents are found scattered throughout the world's oceans, and these structures are often the source of the most biologically rich environments on Earth. They are characterised by high concentrations of methane, hydrogen, and other nutrients, and host a variety of invertebrates, fish, and other organisms. The first hydrothermal vent to be discovered was that of the Juan de Fuca Ridge in the Pacific Ocean, although there are several other hotspots around the world. They are most common in the Atlantic, but several spots have been discovered in the Pacific as well, and a number of hydrothermal vents have been discovered on the east coast of the United States. Hotspots Hotspots are areas in the ocean where concentrations of geothermal fluids reach a level that is conducive to life. A 82157476af
